Specifications for Queues

Queue::Queue();

Post: The Queue has been created and is initialized to be empty.

Error_code Queue::append(const Queue_entry &x);

Post: If there is space, x is added to the Queue as its rear. Otherwise an Error_code of overflow is returned.

Error_code Queue::serve();

Post: If the Queue is not empty, the front of the Queue has been removed. Otherwise an Error_code of underflow is returned.

Error_code Queue::retrieve(Queue_entry &x) const;

Post: If the Queue is not empty, the front of the Queue has been recorded as x. Otherwise an Error_code of underflow is returned.

bool Queue::empty() const;

Post: Return true if the Queue is empty, otherwise return false.
class Extended_queue: public Queue {
public:
    bool full() const;
    int size() const;
    void clear();
    Error_code serve_and_retrieve(Queue_entry &item);
};

bool Extended_queue::full() const;
Post: Return true if the Extended_queue is full; return false otherwise.

void Extended_queue::clear();
Post: All entries in the Extended_queue have been removed; it is now empty.

int Extended_queue::size() const;
Post: Return the number of entries in the Extended_queue.

Error_code Extended_queue::
    serve_and_retrieve(Queue_entry &item);
Post: Return underflow if the Extended_queue is empty. Otherwise remove and copy the item at the front of the Extended_queue to item and return success.
class Queue

(a) Hierarchy diagram
(b) Derived class Extended_queue from base class Queue
Circular Implementation of Queues

Circular queue

Unwinding

Linear implementation
Circular arrays in C++

Equivalent methods to increment an index \( i \) in a circular array:

- \( i = ((i + 1) == \text{max}) \ ? \ 0 : (i + 1); \)
- \( \text{if } ((i + 1) == \text{max}) \ i = 0; \ \text{else } i = i + 1; \)
- \( i = (i + 1) \ % \ \text{max}; \)

Boundary Conditions

- **Queue containing one item**
  - Remove the item.

- **Empty queue**
  - Insert an item.

- **Queue with one empty position**
  - Insert an item.

- **Full queue**
  - Insert an item.
Implementations of Queues

- The *physical model*: a linear array with the front always in the first position and all entries moved up the array whenever the front is deleted.

- A *linear array* with two indices always increasing.

- A *circular array* with front and rear indices and one position left *vacant*.

- A *circular array* with front and rear indices and a Boolean *flag* to indicate fullness (or emptiness).

- A *circular array* with front and rear indices and an *integer counter* of entries.

- A *circular array* with front and rear indices taking *special values* to indicate emptiness.

---

**Programming Precept**

Practice information hiding:
Separate the application of data structures from their implementation.
Circular Implementation of Queues in C++

Class definition:

```cpp
const int maxqueue = 10; // small value for testing

class Queue {
    public:
        Queue();
        bool empty() const;
        Error_code serve();
        Error_code append(const Queue_entry &item);
        Error_code retrieve(Queue_entry &item) const;
    protected:
        int count;
        int front, rear;
        Queue_entry entry[maxqueue];
};
```

Initialization:

```cpp
Queue :: Queue()
{ /* Post: The Queue is initialized to be empty. */
    count = 0;
    rear = maxqueue - 1;
    front = 0;
}

bool Queue :: empty() const
{ /* Post: Return true if the Queue is empty, otherwise return false. */
    return count == 0;
}
Basic Queue Methods

Error_code Queue :: append(const Queue_entry &item)
/* Post: item is added to the rear of the Queue. If the Queue is full return an Error_code of overflow and leave the Queue unchanged. */
{
    if (count >= maxqueue) return overflow;
    count++;
    rear = ((rear + 1) == maxqueue) ? 0 : (rear + 1);
    entry[rear] = item;
    return success;
}

Error_code Queue :: serve() 
/* Post: The front of the Queue is removed. If the Queue is empty return an Error_code of underflow. */
{
    if (count <= 0) return underflow;
    count--; 
    front = ((front + 1) == maxqueue) ? 0 : (front + 1);
    return success;
}

Error_code Queue :: retrieve(Queue_entry &item) const
/* Post: The front of the Queue retrieved to the output parameter item. If the Queue is empty return an Error_code of underflow. */
{
    if (count <= 0) return underflow;
    item = entry[front];
    return success;
}
Demonstration and Testing

int main() 
/*@ Post: Accepts commands from user as a menu-driven demonstration program for the class Extended_queue. 
Uses: The class Extended_queue; the functions introduction, get_command, and do_command. */

{
  Extended_queue test_queue;
  introduction();
  while (do_command(get_command(), test_queue));
}

void introduction()
/* Post: Writes out an introduction and instructions for the user. */

char get_command()
/* Post: Gets a valid command from the user and, after converting it to lower case if necessary, returns it. */

bool do_command(char c, Extended_queue &test_queue)
/* Pre: c represents a valid command. 
Post: Performs the given command c on the Extended_queue test_queue. Returns false if c == ’q’, otherwise returns true. 
Uses: The class Extended_queue. */
void help()

/** Post: */ A help screen for the program is printed, giving the meaning of each command
that the user may enter. */

{
cout << endl
   << "This program allows the user to enter one command" << endl
   << "(but only one) on each input line." << endl
   << "For example, if the command S is entered, then" << endl

   << "Q − Quit" << endl
   << endl
   << "Press < Enter > to continue." << flush;

   char c;
   do {
      cin.get(c);
   } while (c != '\n');
}
bool do_command(char c, Extended_queue &test_queue)
流星 Pre:  c represents a valid command.
流星 Post: Performs the given command c on the Extended_queue test_queue. Returns false if c == 'q', otherwise returns true.
流星 Uses: The class Extended_queue. */

{
    bool continue_input = true;
    Queue_entry x;

    switch (c) {
    case 'r':
        if (test_queue.retrieve(x) == underflow)
            cout << "Queue is empty." << endl;
        else
            cout << endl
                << "The first entry is:" << x
                << endl;
        break;
    case 'q':
        cout << "Extended queue demonstration finished." << endl;
        continue_input = false;
        break;

    // Additional cases will cover other commands.

    }
    return continue_input;
}
Simulation is the use of one system to imitate the behavior of another system. A computer simulation is a program to imitate the behavior of the system under study.

1. The same runway is used for both landings and takeoffs.
2. One plane can land or take off in a unit of time, but not both.
3. A random number of planes arrive in each time unit.
4. A plane waiting to land goes before one waiting to take off.
5. The planes that are waiting are kept in queues landing and takeoff, both of which have a strictly limited size.
```c
int main() // Airport simulation program
/* Pre: The user must supply the number of time intervals the simulation is to run, the expected number of planes arriving, the expected number of planes departing per time interval, and the maximum allowed size for runway queues.
Post: The program performs a random simulation of the airport, showing the status of the runway at each time interval, and prints out a summary of airport operation at the conclusion.
Uses: Classes Runway, Plane, Random and functions run_idle, initialize. */
{
    int end_time; // time to run simulation
    int queue_limit; // size of Runway queues
    int flight_number = 0;
    double arrival_rate, departure_rate;
    initialize(end_time, queue_limit, arrival_rate, departure_rate);
    Random variable; Runway small_airport(queue_limit);
    for (int current_time = 0; current_time < end_time; current_time++) {
        int number_arrivals = variable.poisson(arrival_rate);
        for (int i = 0; i < number_arrivals; i++) {
            Plane current_plane(flight_number++, current_time, arriving);
            if (small_airport.can_land(current_plane) != success)
                current_plane.refuse();
        }
        int number_departures = variable.poisson(departure_rate);
        for (int j = 0; j < number_departures; j++) {
            Plane current_plane(flight_number++, current_time, departing);
            if (small_airport.can_depart(current_plane) != success)
                current_plane.refuse();
        }
        Plane moving_plane;
        switch (small_airport.activity(current_time, moving_plane)) {
            case land: moving_plane.land(current_time); break;
            case takeoff: moving_plane.fly(current_time); break;
            case idle: run_idle(current_time);
            break;
        }
    }
    small_airport.shut_down(end_time);
}
```
The Runway Class Specification

e num Runway_activity {idle, land, takeoff};
class Runway {
public:
  Runway(int limit);
  Error_code can_land(const Plane &current);
  Error_code can_depart(const Plane &current);
  Runway_activity activity(int time, Plane &moving);
  void shut_down(int time) const;

private:
  Extended_queue landing;
  Extended_queue takeoff;
  int queue_limit;
  int num_land_requests; // number of planes asking to land
  int num_takeoff_requests; // number of planes asking to take off
  int num_landings; // number of planes that have landed
  int num_takeoffs; // number of planes that have taken off
  int num_land_accepted; // number of planes queued to land
  int num_takeoff_accepted; // number of planes queued to take off

  int land_wait; // total time of planes waiting to land
  int takeoff_wait; // total time of planes waiting to take off
  int idle_time; // total time runway is idle
};
The Plane Class Specification

```cpp
enum Plane_status { null, arriving, departing };  
class Plane {
  public:
    Plane();
    Plane(int flt, int time, Plane_status status);
    void refuse() const;
    void land(int time) const;
    void fly(int time) const;
    int started() const;
  
  private:
    int flt_num;
    int clock_start;
    Plane_status state;
};
```
Simulation Initialization

```cpp
void initialize(int &end_time, int &queue_limit,
                 double &arrival_rate, double &departure_rate)
/* Pre:  The user specifies the number of time units in the simulation, the maximal queue
sizes permitted, and the expected arrival and departure rates for the airport. 
Post:  The program prints instructions and initializes the parameters end_time, 
queue_limit, arrival_rate, and departure_rate to the specified values. 
Uses: utility function user_says_yes */
{
    cout << "This program simulates an airport with only one runway." << endl
         << "One plane can land or depart in each unit of time." << endl;
    cout << "Up to what number of planes can be waiting to land "
         << "or take off at any time? " << flush;
    cin >> queue_limit;
    cout << "How many units of time will the simulation run?" << flush;
    cin >> end_time;
    bool acceptable;
    do {
        cout << "Expected number of arrivals per unit time?" << flush;

        cout << "Expected number of departures per unit time?" << flush;
        cin >> departure_rate;
        if (arrival_rate < 0.0 || departure_rate < 0.0)
            cerr << "These rates must be nonnegative." << endl;
        else acceptable = true;
        if (acceptable && arrival_rate + departure_rate > 1.0)
            cerr << "Safety Warning: This airport will become saturated."
                 << endl;
    } while (!acceptable);
}
```

Runway Methods

Runway :: Runway(int limit)

/* Post: The Runway data members are initialized to record no prior Runway use and to record the limit on queue sizes. */
{
    queue_limit = limit;
    num_land_requests = num_takeoff_requests = 0;
    num_landings = num_takeoffs = 0;
    num_land_refused = num_takeoff_refused = 0;
    num_land_accepted = num_takeoff_accepted = 0;
    land_wait = takeoff_wait = idle_time = 0;
}

Error_code Runway :: can_land(const Plane &current)

/* Post: If possible, the Plane current is added to the landing Queue; otherwise, an Error_code of overflow is returned. The Runway statistics are updated.

Uses: class Extended_queue. */
{
    Error_code result;
    if (landing.size() < queue_limit)
        result = landing.append(current);
    else
        result = fail;
    num_land_requests++;
    if (result != success)
        num_land_refused++;
    else
        num_land_accepted++;
    return result;
}
Handling Runway Access

Runway::activity(int time, Plane &moving)

/* Post:  If the landing Queue has entries, its front Plane is copied to the parameter moving and a result land is returned. Otherwise, if the takeoff Queue has entries, its front Plane is copied to the parameter moving and a result takeoff is returned. Otherwise, idle is returned. Runway statistics are updated. */

Uses: class Extended_queue. */

{
    Runway::activity in_progress;
    if (!landing.empty()) {
        landing.retrieve(moving);
        land_wait += time - moving.started();
        num_landings++;
        in_progress = land;
        landing.serve();
    }
    else if (!takeoff.empty()) {
        takeoff.retrieve(moving);
        takeoff_wait += time - moving.started();
        num_takeoffs++;
        in_progress = takeoff;
        takeoff.serve();
    }
    else {
        idle_time++;
        in_progress = idle;
    }
    return in_progress;
}
Plane Initialization

Plane :: Plane(int flt, int time, Plane::status status)
/* Post: The Plane data members flt_num, clock_start, and state are set to the values of the parameters flt, time and status, respectively. */
{
    flt_num = flt;
    clock_start = time;
    state = status;
    cout << "Plane number " << flt << " ready to ";
    if (status == arriving)
        cout << "land." << endl;
    else
        cout << "take off." << endl;
}

Plane :: Plane()
/* Post: The Plane data members flt_num, clock_start, state are set to illegal default values. */
{
    flt_num = -1;
    clock_start = -1;
    state = null;
}
void Plane::refuse() const
/* Post: Processes a Plane wanting to use Runway, when the Queue is full. */
{
    cout << "Plane number " << flt_num;
    if (state == arriving)
        cout << " directed to another airport" << endl;
    else
        cout << " told to try to takeoff again later" << endl;
}

void Plane::land(int time) const
/* Post: Processes a Plane that is landing at the specified time. */
{
    int wait = time - clock_start;
    cout << time << ": Plane number " << flt_num << " landed after "
        << wait << " time unit" << ((wait == 1) ? "" : "s")
        << " in the takeoff queue." << endl;
}

void Plane::fly(int time) const
/* Post: Process a Plane that is taking off at the specified time. */
{
    int wait = time - clock_start;
    cout << time << ": Plane number " << flt_num << " took off after "
        << wait << " time unit" << ((wait == 1) ? "" : "s")
        << " in the takeoff queue." << endl;
}
Finishing the Simulation

```cpp
void Runway :: shut_down(int time) const

/* Post: Runway usage statistics are summarized and printed. */
{
    cout << "Simulation has concluded after " << time << " time units." << endl
    << "Total number of planes processed "
    << (num_land_requests + num_takeoff_requests) << endl
    << "Total number of planes asking to land "
    << num_land_requests << endl
    << "Total number of planes asking to take off "
    << num_takeoff_requests << endl
    << "Total number of planes accepted for landing "
    << num_land_accepted << endl
    << "Total number of planes accepted for takeoff "
    << num_takeoff_accepted << endl
    << "Total number of planes refused for landing "
    << num_land_refused << endl
    << "Total number of planes refused for takeoff "
    << num_takeoff_refused << endl
    << "Total number of planes that landed "
    << num_landings << endl
    << "Total number of planes that took off "
    << num_takeoffs << endl
```
"Total number of planes left in landing queue "
landing.size() << endl

"Total number of planes left in takeoff queue "
takeoff.size() << endl;

cout << "Percentage of time runway idle "
100.0 * ((float) idle_time)/((float) time) << "%" << endl;

cout << "Average wait in landing queue "
((float) land_wait)/((float) num_landings) << " time units";

cout << endl << "Average wait in takeoff queue "
((float) takeoff_wait)/((float) num_takeoffs)
" time units" << endl;

cout << "Average observed rate of planes wanting to land "
((float) num_land_requests)/((float) time)
" per time unit" << endl;

cout << "Average observed rate of planes wanting to take off "
((float) num_takeoff_requests)/((float) time)
" per time unit" << endl;
}
1. Before choosing implementations, be sure that all the data structures and their associated operations are fully specified on the abstract level.

2. In choosing between implementations, consider the necessary operations on the data structure.

3. If every object of class A has all the properties of an object of class B, implement class A as a derived class of B.

4. Consider the requirements of derived classes when declaring the members of a base class.

5. Implement is-a relationships between classes by using public inheritance.

6. Implement has-a relationships between classes by layering.

7. Use Poisson random variables to model random event occurrences.
